ANALYSIS OF HOUSING DATA COLLECTED IN A LEAD-BASED
PAINT SURVEY IN PITTSBURGH, PENNSYLVANIA

Part II

Abstract

This report represents Part II of a two-part document describing a lead-based paint survey conducted in Pittsburgh, Pennsylvania. Part I of this document (NBSIR 77-1250) presented details of the design, methodology and findings of this survey. The current report (Part II) presents and describes a series of tables summarizing the Pittsburgh survey data base, which includes measured lead levels of various surfaces in dwelling units and blood lead levels of children resident in those units. Most of the data analyses conducted in Part I derive from these tables. Thus, the tabulations given in this report provide not only the basis for those analyses but also a potential source for additional data analyses.

Key Works: Blood lead; children; data analysis; housing; lead paint; lead poisoning; surveys.

1. INTRODUCTION

During 1974 and 1975, the National Bureau of Standards (NBS), under sponsorship of the Department of Housing and Urban Development (HUD), conducted, in cooperation with the Allegheny County Health Department, a large-scale survey of housing in Pittsburgh, Pennsylvania. This survey collected various data on the extent, magnitude and distribution of lead-bearing paint surfaces within the dwelling units of the sampled area. Also, blood samples and socioeconomic information were collected from children under seven years of age resident in those units. In contrast to previous surveys, the Pittsburgh lead-based paint survey was a large-scale, statistically designed effort aimed at characterizing the lead levels in dwelling units comprising an entire city, and not simply a high-risk area. Additional details concerning the design, methodology and findings of the survey are provided in [1]*, which constitutes Part I of this two-part document. A statistical study of the children's blood lead levels, together with details of the chemical analysis techniques employed, can be found in a previous NBS report [2].

The current report (Part II) presents and describes a series of tables that summarize the Pittsburgh survey data. In fact, the data analyses given in [1] are for the most part derived from these tables. In addition, the tables provide a potential source for further data analyses, based on other combinations of housing characteristics (described in Section 2) which may not have been explicitly treated in Part I.

The entire set of tabulations actually produced, using the Pitts-

*Figures in brackets indicate references listed in Section 3.

burgh data base, are far too voluminous for inclusion in this report. Accordingly, a representative subset of those tables is provided here, and this set should suffice for the purposes of most analyses. Listings of additional tables (which follow the same formats as those described here) can be provided by NBS, upon request, to interested researchers.

In Section 2, the classifications used in structuring the tables are defined and the data elements forming each table are discussed. The tables themselves (arranged into three sets of tables) are displayed in the Appendices. These tables provide supporting data tabulations on which the analyses and conclusions of Part I have been based.

2. DESCRIPTION OF THE TABLES

The various tables provided in this report have been classified into three distinct sets: those designated as "Set A," "Set B," and "Set C." The tables in Sets A and B summarize the interior lead level measurements obtained in the survey according to the values of certain housing-related variables. (The data collection form on which these and other measurements were recorded is shown in Appendix D.) The tables in Set C relate the interior lead level measurements in dwelling units to the blood lead levels found in children residing in those units, also grouped according to various housing variables. The contents and use of each set of tables will be discussed in this section.

2.1 Set A Tables (Housing Data)

Tables from this set are those from which most of the cumulative distributions of Part I have been derived. Each table of this set shows (by age of unit, occupancy class, room type, surface type and surface condition) the fractions of the dwelling units, rooms, and surfaces in which the highest lead level reading equals or exceeds certain specified levels. Since each table involves a number of variables and stratifications for such variables, this information will be described first. Subsequently, the interpretation and use of these tables will be discussed in some detail.

Tables have been calculated for every combination of values assumed by the variables listed below. Only a certain subset of these calculated tables are, however, presented in the Set A Tables. An asterisk in the list below denotes those values of the variables for which a corresponding

table has been included in Appendix A.

I. Age of Dwelling Unit

- *Pre 1940
- *1940-1959
- *1960-1975
- *ALL

II. Occupancy Class

- SINGLE FAMILY - OWNER OCCUPIED - FHA MORTGAGE
- SINGLE FAMILY - OWNER OCCUPIED
- SINGLE FAMILY - RENTER OCCUPIED
- *SINGLE FAMILY - ALL
- MULTIFAMILY - 2 to 4 UNITS/BUILDING
- MULTIFAMILY - 5 or MORE UNITS/BUILDING
- *MULTIFAMILY - (2 or MORE UNITS/BUILDING)
- PUBLIC HOUSING - 2 to 4 UNITS/BUILDING
- PUBLIC HOUSING - 5 or MORE UNITS/BUILDING
- *PUBLIC HOUSING - ALL
- *ALL

III. Room Type

- *DRY (all rooms except kitchens and bathrooms)
- *WET (kitchens and bathrooms)
- *ALL

IV. Surface Type (interior)

- *WALLS
- *WINDOWS
- *DOORS

V. Surface Condition

This designation does not appear in the data base for each surface, but rather is recorded by surface type (walls, trim) for each room. Note that inspectors were instructed to assign these condition codes on the basis of the worst condition present in the room.

*PEELING - denotes a surface on which the paint film itself is peeling, flaking, blistering or powdering.

*BAD - denotes a surface which has a bad substrate regardless of the condition of the surface; this category includes all

imperfections except hairline cracks, nail holes, etc.

*EITHER - denotes a surface which is either PEELING or BAD or both.

*BOTH - denotes a surface that is both PEELING and BAD.

*ALL - denotes all surfaces, regardless of condition.

VI. Specified Lead Levels

*0.0 mg/cm²
*0.5 mg/cm²
*1.0 mg/cm²
1.5 mg/cm²
*2.0 mg/cm²
2.5 mg/cm²
3.0 mg/cm²
4.0 mg/cm²
*5.0 mg/cm²
*7.5 mg/cm²
10.0 mg/cm²

The tables in Set A provide (for defined values of the variables listed in I-V) the number and fraction of dwellings, rooms or surfaces for which the highest lead level equals or exceeds the specified lead level. Since it is possible to obtain negative lead level readings, such negative readings have been retained for the calculation of statistical quantities, such as the mean, median and standard deviation. However, any derived statistic which assumes a negative value has been set equal to zero for the purposes of the tables in this report. As a result, any table with specified lead level 0.0 mg/cm² actually provides a count of the number of dwellings, rooms, or surfaces according to the categories listed in I-V.

Each table of Set A contains as a heading a room type, a specified lead level, and an occupancy class. The three groups of columns refer to the three surface types, while the four groups of rows (ten lines each)

refer to the age group of the dwelling unit. For each age group, the first line gives counts for the number of dwelling units in which at least one of the lead level readings equals or exceeds the specified lead level; these counts on the first line are further categorized by surface condition within surface type. The second line gives the fraction of the dwelling units in which at least one of the lead level readings equals or exceeds the specified level, also categorized by surface type and surface condition.

Lines 3-6 contain, for each column, one half the width of a confidence interval* (about the fraction in line 2) with confidence levels 99%, 95%, 90%, and 80%, respectively. For example, the third table of Set A shows that a 99% confidence interval, for the true fraction of all pre 1940 single-family dwelling units with at least one dry room wall reading equal to or exceeding 1.0 mg/cm^2 , is $.636 \pm .028$ (i.e., it extends from .608 to .664). In repeated sampling, the true fraction should lie in a 99% confidence interval (calculated in this way) 99 times out of 100. Likewise, a 95% confidence interval for the true fraction is given by $.636 \pm .021$, while an 80% confidence interval for the fraction is given by $.636 \pm .014$.

Lines 7 and 8 give the number and fraction of rooms (by surface type and condition) with at least one lead level reading equal to or exceeding

*The calculation of these confidence intervals follows the procedure described in Appendix B of [3]. Despite the fact that the underlying statistical distribution of individual lead level readings is highly non-normal [1], the sample sizes given in these tables are usually large enough (e.g., in excess of 50 observations) for the Central Limit Theorem [4] to hold. Since the confidence interval calculations rely on the application of this theorem, the indicated confidence intervals will be valid so long as the sample size is sufficiently large.

the specified lead level. Since only a single lead level reading was taken for doors and windows within a room, the quantities appearing on these two lines for doors and windows also represent the number and fraction of lead level readings satisfying the stated conditions.

Lines 9 and 10 give the number and fraction of surfaces (by surface type and condition) with at least one lead level reading equal to or exceeding the specified lead level. For doors and windows, it is assumed that all doors within a room have the same lead level as the measured door, and that all windows have the same lead levels as the measured window. In addition, the condition code for walls in a room is (conservatively) assumed to characterize all walls within the room, while the trim condition code is assumed to characterize all windows and doors within the room.

2.2 Set B Tables (Housing Data)

In contrast to the tables of Set A (which summarize the lead level readings by dwelling, room and surface), the tables of Set B contain information aggregated on a room basis. In addition, these tables illustrate variations in lead levels (a) within rooms, and (b) among rooms of the same type. The Set B tables (found in Appendix B) use variables having stratifications similar to those described in relation to Set A. The categorizing variables, and their associated values, are described below. As in Set A, the cases appearing in tables of this report are indicated by an asterisk. The remaining cases have been calculated but do not appear here.

I. Age of Dwelling Unit

*Pre 1940
*1940-1959
*1960-1975
*ALL

II. Occupancy Class

*SINGLE FAMILY
MULTIFAMILY
*ALL

III. Room Type

*DRY
*WET
ALL

IV. Surface Type (interior)

*WALLS
*TRIM (doors, windows, baseboards, cabinets, fireplaces)
*ALL

V. Surface Condition

*GOOD (surface tight and substrate good)
*BAD (surface peeling and/or substrate bad)
*ALL

VI. Specified Lead Intervals

* 0.0 - 0.49 mg/cm²
*0.50 - 0.99 mg/cm²
*1.00 - 1.49 mg/cm²
*1.50 - 1.99 mg/cm²
*2.00 - 2.49 mg/cm²
*2.50 - 2.99 mg/cm²
*3.00 - 3.99 mg/cm²
*4.00 - 4.99 mg/cm²
*5.00 - 7.49 mg/cm²
*7.50 - 9.99 mg/cm²
*>10.0 mg/cm²
*ALL

Each table is identified by a lead level interval, an occupancy class, and a room type. The statistics given in the body of the table refer to those rooms in which the mean wall lead level lies in the

specified lead level interval. In each table, the four groups of columns represent the four dwelling unit age categories, while the four groups of rows represent certain collections of surface types.

In the group of ten lines with the heading WALLS, the first line contains a count of the number of rooms (by age category and surface condition) with mean wall lead level in the specified interval. The second line converts this number into a percent of all rooms corresponding to that room type, occupancy class, age category, and room (wall) condition.

Lines 3-4 contain, respectively, the mean of the room means for the wall lead levels and the standard deviation of these room means. In a similar way, lines 5-6 represent the mean and standard deviation of the within-room standard deviations for wall lead levels. The last four lines represent, respectively, the mean and standard deviation of the room medians, and the mean and standard deviation of the highest wall lead level in the room.

The TRIM and ALL groups of rows contain the same quantities as those given in lines 3-10 above for the WALLS group, except that these statistics are now based on the lead levels of the trim (TRIM), or on the walls plus ceilings plus trim (ALL). Again, these quantities have been calculated for all rooms in which the mean wall lead level lies within the specified lead interval.

The final group of lines (T-W) contains statistics similar to those on lines 3-4 and 7-10 in the WALLS group, except that the calculations are now based on differences between trim and wall surfaces. More specifically, the two lines headed by MEAN give the mean and standard

deviation of the mean trim minus the mean wall reading for each room. Similarly, the lines for MEDIAN are based on median trim minus median wall, while those for HIGH are based on high trim minus high wall. As before, such quantities are calculated for all rooms in which the mean wall lead level lies within the specified lead interval.

2.3 Set C Tables (Housing/Blood Data)

The tables of this set are quite similar to the Set B tables, except that the children's blood lead levels have been used to control the calculations of room-based statistics for lead levels. Thus all calculations for these tables are performed using those dwelling units containing children for whom blood lead levels had been determined. Apart from the blood lead level intervals described below, the remaining variables and their values remain the same as those listed in I-V, Set B.

VI. Specified Blood Lead Intervals

- * 0 - 4 $\mu\text{g}/100\text{ ml}$
- * 5 - 9 $\mu\text{g}/100\text{ ml}$
- *10 - 14 $\mu\text{g}/100\text{ ml}$
- *15 - 19 $\mu\text{g}/100\text{ ml}$
- *20 - 24 $\mu\text{g}/100\text{ ml}$
- *25 - 29 $\mu\text{g}/100\text{ ml}$
- *30 - 34 $\mu\text{g}/100\text{ ml}$
- *35 - 39 $\mu\text{g}/100\text{ ml}$
- *40 - 44 $\mu\text{g}/100\text{ ml}$
- *45 - 49 $\mu\text{g}/100\text{ ml}$
- * \geq 50 $\mu\text{g}/100\text{ ml}$
- *ALL

Each table is identified by a blood lead interval, occupancy class and room type; also given are the number and percent of children associated with that occupancy class with blood lead levels in the specified interval. The four groups of columns represent the four dwelling unit

age categories. The line denoted by CHILDREN gives for each age category the number and percent of children within that occupancy class having blood lead levels in the specified interval. As in the tables from Set B, the four groups of rows represent certain collections of surface types. Apart from the differences noted above and the fact that a line does not appear for PERCENT (of rooms), the elements of this table correspond exactly to those defined in Set B.

15. SUPPLEMENTARY NOTES				
16. ABSTRACT (A 200-word or less factual summary of most significant information. If document includes a significant bibliography or literature survey, mention it here.) <p>This report represents Part II of a two-part document describing a lead-based paint survey conducted in Pittsburgh, Pennsylvania. Part I of this document (NBSIR 77-1250) presented details of the design, methodology and findings of this survey. The current report (Part II) presents and describes a series of tables summarizing the Pittsburgh survey data base, which includes measured lead levels of various surfaces in dwelling units and blood lead levels of children resident in those units. Most of the data analyses conducted in Part I derive from these tables. Thus, the tabulations given in this report provide not only the basis for those analyses but also a potential source for additional data analyses.</p>				
17. KEY WORDS (six to twelve entries; alphabetical order; capitalize only the first letter of the first key word unless a proper name; separated by semicolons) <p>Key Works: Blood lead; children; data analysis; housing; lead paint; lead poisoning; surveys.</p>
